Completeness was defined as the percentage of interactions with an entry that provided specified content describing each of the extracted items (i.e., mechanism, clinical effects, severity, level of certainty, course of action). Basic resources for pharmacy education [Internet]. Most drug-ethanol interactions are due to the latter mechanism. Comprehensive evaluation of drug interaction screening programs: discrepancies and concordances. Clin Pharmacokinet. Clinical effects were defined as the potential signs and symptoms resulting from the interaction, as well as patient outcomes. For example, Micromedex stood out for having the best coverage of drug-tobacco interactions, complete information across assessed items (e.g., mechanism, clinical effects) for both interaction types, and among the highest consistency scores. Alcohol dehydrogenase (CYP2E1) is a metabolizing enzyme for ethanol and is inhibited by ethanol; thus, ethanol can interact with substrates, inhibitors, or inducers of CYP2E1 [3]. Completeness results are described in Table 3. Resources were omitted from tier calculations if 3 or fewer entries were available for analysis. Conclusions Scope and completeness were high for drug-ethanol interactions, but low for drug-tobacco interactions. Our sample size was potentially smaller than ideal for analyzing drug-tobacco completeness and consistency, primarily due to lower than expected scope scores. We pride ourselves on our rigorous editorial processes and innovative approach to content delivery. Drug Interaction Facts and Micromedex were among the highest scoring resources for both drug-ethanol (73.7%, 68.6%) and drug-tobacco (75.0%, 32.3%) consistency. 13 Abarca J, Malone DC, Armstrong EP, Grizzle AJ, Hansten PD, Van Bergen RC, Lipton RB. The objective of this study was to evaluate point-of-care drug interaction resources for scope, completeness, and consistency in drug-ethanol and drug-tobacco content. 2014 Mar;70(3):313-8. Drug interactions: Flockhart table: P450 drug interaction table [Internet]. Beckett, Curtis D. Resources were omitted from consistency calculations if they had three or fewer entries. Consistency among resources was highly variable, with Micromedex and Drug Interaction Facts providing good consistency for both interaction types. IBM SPSS statistics. 23 Indiana University School of Medicine. Data were gathered and entered into the data collection form over a three-month period in early 2018. For drug-ethanol interactions, Lexicomp placed in the highest tier for both scope and completeness; whereas for drug-tobacco interactions, Micromedex placed in the highest tier for both scope and completeness. Micromedex® solutions drug interactions [Internet]. Results of the tier analysis are described in Table 4. Each resource had distinct strengths and limitations depending on interaction type and information of interest, and results from this study can help direct information professionals and users to the higher quality resources depending on specific needs. Drug interaction facts 2015. J Am Med Inform Assoc. Scope (presence of an entry), completeness (content describing mechanism, clinical effects, severity, level of certainty, and course of action for each present interaction; up to 1 point per assessed item for a total possible score of 5 points), and consistency (similarity among resources) were evaluated. Differences among resources (especially for Drug Interactions Analysis and Management and Stockley's Drug Interactions), in terms of completeness, tended to be driven by deficiencies in severity and level of certainty information. Ethanol and tobacco have the potential to interact with therapeutic drugs through several mechanisms [3, 4]. Drug-ethanol interaction entries were most commonly present in Lexicomp (84.9%), Clinical Pharmacology (83.0%), and Stockley's Drug Interactions (73.6%), compared to other resources (p
